EE6497 Survey Report

Pattern Recognition and Deep Learning

Submission date: [Actual submission date]

Statement of Originality

I hereby certify that the work embodied in this report is the result of original research and is free of plagiarised materials.

Team members, contributions and signatures

Names must match matriculation cards exactly and appear in alphabetical order. Each member signs and dates their own row.

Full name	Contribution	Date signed	Signature
[Member 1 full name]	[Actual contribution]	[DD/MM/YYYY]	[Real signature]

Template fields are unsigned. Sign only after reviewing the completed report.

Template setup: set the actual team size (1–8) and all member fields in `config.tex`. Remove this setup note before submission.

[Your Original Survey Title]

[Member 1 full name]
School of Electrical and Electronic Engineering
Nanyang Technological University, Singapore

***Abstract*—[Replace this with an original abstract stating the survey topic, scope, organizing perspective, main synthesis and future directions. Write it after reviewing the literature. This template contains no research findings.]**

***Index Terms*—[Topic keyword], [method keyword], literature survey**

I. Introduction

[Define a focused problem in pattern recognition or deep learning. Explain its importance using verified sources, set the survey boundaries, and state the questions this report will answer. Use an original title that differs from existing papers.]

[Describe how this survey organizes and compares the literature. Replace every blue instruction and bracketed field before submission. Do not present these prompts as completed research.]

II. Scope and Literature Selection

[Record the actual search sources, search terms, search date, publication period, and inclusion/exclusion criteria. Focus on recent work (approximately the last three years) from the venues specified in the instructor email. Check existing surveys and explain how your scope differs. Do not invent a search process or paper count.]

III. Background and Taxonomy

[Define every reused acronym and each mathematical symbol at first appearance. Explain necessary concepts in your own words with appropriate citations. Develop a taxonomy justified by the papers you read. Fig. 1 is an editable structural example; replace its categories and relationships with your own synthesis.]

IV. Comparative Analysis

[Compare approaches using a consistent set of criteria. Identify the exact method in each reviewed work and distinguish a newly proposed model from an applied or used existing model.

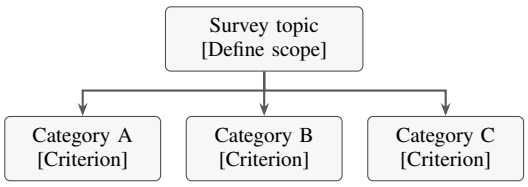

Fig. 1. Original editable taxonomy layout. Placeholder categories and links must be replaced with a literature-supported synthesis. No research conclusion is represented.

TABLE I
Editable evidence matrix: all entries are placeholders

Source	Main idea	Evidence / setting	Limitation
[Citation]	[Describe]	[Verify]	[Discuss]
[Citation]	[Describe]	[Verify]	[Discuss]
[Citation]	[Describe]	[Verify]	[Discuss]

Discuss assumptions, evidence, results and trade-offs across papers. Table I provides an original editable layout, with no invented sources or measurements.]

[When reproducing a reported number, cite its actual source and retain the dataset, evaluation protocol, metric definition and units. Distinguish reported results from your own experiments, if any. Avoid treating incomparable settings as a valid ranking.]

V. Learning Points and Future Directions

[Synthesize what the reviewed evidence teaches. Explain agreement and disagreement across studies, identify specific open questions, and propose future research with a rationale grounded in the survey. Distinguish your proposals from established results.]

VI. Conclusion

[Answer the survey questions and summarize the supported takeaways. Do not introduce claims or citations that have not been discussed.]

Template reference example

The instructor recommends the survey by Ker et al. [1] as a writing example. This citation demonstrates IEEE bibliography formatting; it does not select a topic or supply findings for this report. Replace this paragraph with your own discussion and retain only references actually used.

TURNITIN REPORT ATTACHMENT PLACEHOLDER

No Turnitin report is attached to this template.

After completing the survey, obtain and review the authentic Turnitin report. Save it as `attachments/turnitin-report.pdf`, then set `\AttachTurnitintrue` in `config.tex`. Recompile to append all pages after the references. This placeholder page will disappear automatically.

If your Turnitin export cannot be included by the compiler, download the completed survey PDF and append the authentic Turnitin PDF with a PDF merger. Preserve the order: signed cover, IEEE body and references, Turnitin report.

Check the combined PDF before submitting it to NTULearn. Do not submit this placeholder page as a Turnitin report, and do not invent a similarity score.

The instructor permits a screenshot of the overlap-score page only if the complete Turnitin report cannot be appended. Convert that authentic screenshot to a one-page PDF using the same filename and enable the attachment. There is no acceptable similarity-score threshold: inspect the highlighted passages and revise copied sentences.
